

Special assembly

“ insect screen”

1. Function

For a comfortable indoor climate it's incessantly to open up the louvre windows. Through this, not only fresh air finds it's way into the room - also insects can come in. The EuroLam Louvre Windows can be equipped with insect screens. They will be added to the Louvre window without any visual disturbance. The insect screen can be easily installed and is characterized by persistence and fitting accuracy.

2. Profile

All our profiles are made out of extruded anodised, powder or wet paint coated aluminium. The mitred profiles are grouted with interposed corner angles and additionally cemented for extra stability and resistance.

3. Fabric

Centrepiece of each of our insect screens is it's fabric. It's made out of run-proof welded and plastic-coated fibreglass fabric, which is weather-resistant and tearproof. The colours grey and black give it a discreet optic. We use fabric out of stainless steel or aluminium by request. We also offer screens for pets. We string these screens with special Pet-Screen-fabric. The vinyl coating makes the polyester fabric seven times more resistant during scratching. All fabrics can be easily exchanged in case of damage, without affecting the profile – which explain it's persistence.
